

INFORMATION YOU CAN TRUST

Conflicting Answers

Public-service instructions compared
with evidence and clear next steps

Transparency & Accountability

Official pages can leave a question unresolved

An adult preparing a first Kenyan passport finds different payment-document instructions.

Which statement applies, and whom should they ask?

Problem hypothesis: uncertainty can make preparation harder.
The pilot has not measured prevalence, costs or repeat visits.

OBSERVED EVIDENCE

Two invoices and three receipts

SOURCE A

Directorate of Immigration Services

2 payment invoices

Checked: 2026-09-19 · Effective: not stated

Curated for an adult citizen by birth. Confirm local office applicability.

[Open original source ↗](#)

SOURCE B

eCitizen Immigration passport page

three application receipts

Checked: 2026-09-19 · Effective: not stated

Broader application page, scoped by the prototype curator. Currency and local applicability remain unconfirmed.

[Open original source ↗](#)

Actual prototype screen. The terms may refer to different documents.
Neither effective date is established. This is a clarification case, not a proven contradiction.

Context determines the finding

Different applicant or location: different scope

Non-overlapping effective dates: different periods

Different document terms: terminology review

Absent statement: incomplete evidence

Same term, different value: potential conflict

Unknown dates remain visible. A newer retrieval never automatically wins.

Evidence becomes a concrete next step

Inspect both source statements and their dates.
Prepare the matching items in a partial checklist.
Copy a precise clarification request with source links.
Review the evidence again when the catalog changes.

The application does not send messages, take payment or submit applications.

A guide that can reopen offline

Save a dated comparison explicitly on the device.
Download text or print an action pack.
Use English or draft Swahili.
Clear saved data after using a shared device.

First access needs internet and a browser. Swahili needs independent review.
No identity-document uploads. Downloads and browser history remain outside deletion.

IMPLEMENTATION

Small components with reviewable behavior

Flask serves a read-only public catalog.
A deterministic Python engine compares curated claims.
SQLite runs locally, with PostgreSQL support for Neon.
Render configuration and actual Git history are included.

No live crawler, runtime LLM, background notifications or automatic authority ranking.

The core comparison and offline flows work

14 local automated tests passed.

Browser checks covered the evidence classes and offline reload.

Version changes clear saved ticks for review.

Synthetic clarification stays separate from real evidence.

These checks do not establish live cloud readiness, institutional acceptance, translation accuracy or community impact.

Measure whether users know what to do next

Test whether people identify unresolved questions accurately.
Compare the time needed to find the relevant source.
Ask whether clarification requests are understandable.
Expand through reviewed local catalogs and content owners.

NEXT STEPS

Local evidence and accountable review

Validate the journey with intended users and the institution.
Review Swahili with an independent speaker.
Assign responsibility for source updates.
Verify the deployment on the intended cloud accounts.
